

How to connect to a PostgreSQL database in Lasetnet

Mikael Wängelin - 2021-08-25 - Comments (0) - Lasetnet General Information

Lasetnet

Lasetnet 6.7 or above needs to have an external driver to use a **PostgreSQL** database connection. Follow these steps:

1. Find the `libpq.dll` and `libintl-8.dll` files from inside the *PostgreSQL* installation folder.
2. This file then needs to be placed into the main installation folder of Lasetnet.
3. After copying, restart the Lasetnet service and reopen the Lasetnet Developer.

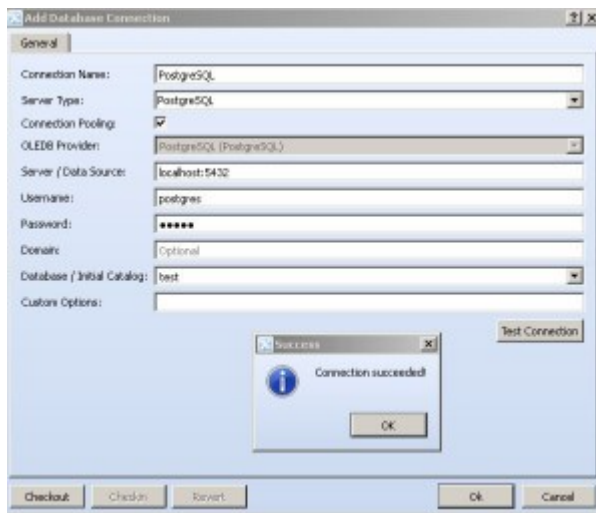

64-bit Lasetnet 6.7 and above requires 64-bit drivers.

4. Define the PostgreSQL path in Environment Variables: `%PGR00T%\bin`.

5. To get a connection with PostgreSQL installed on the same server as Lasetnet, the fields below need to be set:

6. Click the **Test Connection** button to verify the setting. If every field is correct then you will have the message "Connection succeeded!" as below:

This connection can be saved and then referenced in Database Commands.
